Classical Set Theory

A set is a collection of objects with a common property.

Outline

1. Fuzzy sets and set-theoretic operations.
2. Fuzzy relations.
3. Fuzzy systems
4. Linguistic model, approximate reasoning

Classical Set Theory

A set is a collection of objects with a common property.

Examples:

- Set of natural numbers smaller than 5: $A = \{1, 2, 3, 4\}$

Classical Set Theory

A set is a collection of objects with a common property.

Examples:

- Set of natural numbers smaller than 5: $A = \{1, 2, 3, 4\}$
- Unit disk in the complex plane: $A = \{z \mid z \in \mathbb{C}, |z| \leq 1\}$

Classical Set Theory

A set is a collection of objects with a common property.

Examples:

- Set of natural numbers smaller than 5: $A = \{1, 2, 3, 4\}$
- Unit disk in the complex plane: $A = \{z \mid z \in \mathbb{C}, |z| \leq 1\}$
- A line in \mathbb{R}^2 : $A = \{(x, y) \mid ax + by + c = 0, (x, y, a, b, c) \in \mathbb{R}\}$

Representation of Sets

- Enumeration of elements: $A = \{x_1, x_2, \dots, x_n\}$
- Definition by property: $A = \{x \in X \mid x \text{ has property } P\}$
- Characteristic function: $\mu_A(x) : X \rightarrow \{0, 1\}$

$$\mu_A(x) = \begin{cases} 1 & x \text{ is member of } A \\ 0 & x \text{ is not member of } A \end{cases}$$

Set of natural numbers smaller than 5

Why Fuzzy Sets?

- Classical sets are good for well-defined concepts (maths, programs, etc.)
- Less suitable for representing commonsense knowledge in terms of vague concepts such as:
 - a **tall** person, **slippery** road, **nice** weather, ...
 - want to buy a **big** car with **moderate** consumption
 - If the temperature is **too low**, increase heating a **lot**

Fuzzy sets

Classical Set Approach

set of tall people $A = \{h \mid h \geq 180\}$

Logical Propositions

“John is tall” ... true or false

John's height: $h_{John} = 180.0$ $\mu_A(180.0) = 1$ (true)
 $h_{John} = 179.5$ $\mu_A(179.5) = 0$ (false)

Fuzzy Set Approach

$$\mu_A(h) = \begin{cases} 1 & h \text{ is full member of } A \quad (h \geq 190) \\ (0, 1) & h \text{ is partial member of } A \quad (170 < h < 190) \\ 0 & h \text{ is not member of } A \quad (h \leq 170) \end{cases}$$

R. Babuška, Delft Center for Systems and Control, SC4081

13

Fuzzy Logic Propositions

“John is tall” ... degree of truth

John's height: $h_{John} = 180.0$ $\mu_A(180.0) = 0.6$
 $h_{John} = 179.5$ $\mu_A(179.5) = 0.56$
 $h_{Paul} = 201.0$ $\mu_A(201.0) = 1$

R. Babuška, Delft Center for Systems and Control, SC4081

14

Subjective and Context Dependent

tall in China

tall in Europe

tall in NBA

R. Babuška, Delft Center for Systems and Control, SC4081

15

Shapes of Membership Functions

R. Babuška, Delft Center for Systems and Control, SC4081

16

Representation of Fuzzy Sets

- Pointwise as a list of membership/element pairs:

$$A = \{\mu_A(x_1)/x_1, \dots, \mu_A(x_n)/x_n\} = \{\mu_A(x_i)/x_i \mid x_i \in X\}$$

- As a list of α -level/ α -cut pairs:

$$A = \{\alpha_1/A_{\alpha_1}, \alpha_2/A_{\alpha_2}, \dots, \alpha_n/A_{\alpha_n}\} = \{\alpha_i/A_{\alpha_i} \mid \alpha_i \in (0, 1)\}$$

Representation of Fuzzy Sets

- Analytical formula for the membership function:

$$\mu_A(x) = \frac{1}{1 + x^2}, \quad x \in \mathbb{R}$$

or more generally

$$\mu(x) = \frac{1}{1 + d(x, v)}$$

$d(x, v) \dots$ dissimilarity measure

Various shorthand notations: $\mu_A(x) \dots A(x) \dots a$

Linguistic Variable

Basic requirements: coverage and semantic soundness

Properties of fuzzy sets

Support of a Fuzzy Set

$$\text{supp}(A) = \{x \mid \mu_A(x) > 0\}$$

support is an *ordinary set*

Core (Kernel) of a Fuzzy Set

$$\text{core}(A) = \{x \mid \mu_A(x) = 1\}$$

core is an *ordinary set*

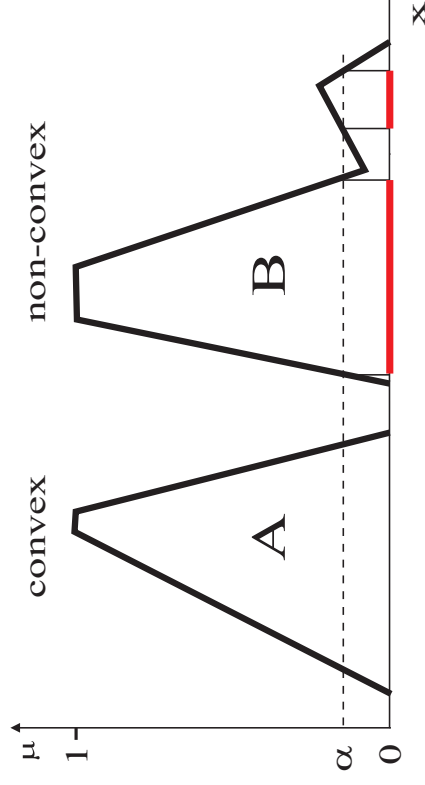

α -cut of a Fuzzy Set

$$A_\alpha = \{x \mid \mu_A(x) > \alpha\} \quad \text{or} \quad A_\alpha = \{x \mid \mu_A(x) \geq \alpha\}$$

A_α is an *ordinary set*

Convex and Non-Convex Fuzzy Sets

A fuzzy set is convex \Leftrightarrow all its α -cuts are convex sets.

Non-Convex Fuzzy Set: an Example

High-risk age for car insurance policy.

Fuzzy Numbers and Singletons

Fuzzy linear regression: $y = 3x_1 + 5x_2$

Fuzzy set-theoretic operations

Complement (Negation) of a Fuzzy Set

$$\mu_{\bar{A}}(x) = 1 - \mu_A(x)$$

Intersection (Conjunction) of Fuzzy Sets

$$\mu_{A \cap B}(x) = \min(\mu_A(x), \mu_B(x))$$

Other Intersection Operators (T-norms)

Probabilistic “and” (product operator):

$$\mu_{A \cap B}(x) = \mu_A(x) \cdot \mu_B(x)$$

Lukasiewicz “and” (bounded difference):

$$\mu_{A \cap B}(x) = \max(0, \mu_A(x) + \mu_B(x) - 1)$$

Many other t-norms $\dots [0, 1] \times [0, 1] \rightarrow [0, 1]$

Union (Disjunction) of Fuzzy Sets

$$\mu_{A \cup B}(x) = \max(\mu_A(x), \mu_B(x))$$

Other Union Operators (T-conorms)

Probabilistic “or”:

$$\mu_{A \cup B}(x) = \mu_A(x) + \mu_B(x) - \mu_A(x) \cdot \mu_B(x)$$

Lukasiewicz “or” (bounded sum):

$$\mu_{A \cup B}(x) = \min(1, \mu_A(x) + \mu_B(x))$$

Many other t-conorms $\dots [0, 1] \times [0, 1] \rightarrow [0, 1]$

Linguistic Modifiers (Hedges)

Modify the meaning of a fuzzy set.

For instance, *very* can change the meaning of the fuzzy set *tall* to *very tall*.

Other common hedges: *slightly*, *more or less*, *rather*, etc.

Usual approach: *powered hedges*:

$$\mu_{M_p(A)} = \mu_A^P$$

Demo of a Matlab tool

Linguistic Modifiers: Example

$$\mu_{\text{very}}(A) = \mu_A^2 \quad \mu_{\text{More or less}}(A) = \sqrt{\mu_A}$$

Linguistic Modifiers

Fuzzy Set in Multidimensional Domains

$$A = \{\mu_A(x, y) \mid (x, y) \in X \times Y\}$$

Cylindrical Extension

Cylindrical Extension

Cylindrical Extension

$$\text{ext}_{x_2}(A) = \{\mu_A(x_1) \mid (x_1, x_2) \in X_1 \times X_2\}$$

Projection

R. Babuska, Delft Center for Systems and Control, SC4081

41

Projection onto X_1

$$\text{proj}_{x_1}(A) = \{ \sup_{x_2 \in X_2} \mu_A(x_1, x_2) \mid x_1 \in X_1 \}$$

R. Babuska, Delft Center for Systems and Control, SC4081

42

Projection onto X_2

$$\text{proj}_{x_2}(A) = \{ \sup_{x_1 \in X_1} \mu_A(x_1, x_2) \mid x_2 \in X_2 \}$$

R. Babuska, Delft Center for Systems and Control, SC4081

43

Intersection on Cartesian Product Space

An operation between fuzzy sets are defined in different domains results in a multi-dimensional fuzzy set.

Example: $A_1 \cap A_2$ on $X_1 \times X_2$:

R. Babuska, Delft Center for Systems and Control, SC4081

44

Intersection on Cartesian Product Space

An operation between fuzzy sets are defined in different domains results in a multi-dimensional fuzzy set.

Example: $A_1 \cap A_2$ on $X_1 \times X_2$:

R. Babuska, Delft Center for Systems and Control, SC0081

45

Intersection on Cartesian Product Space

An operation between fuzzy sets are defined in different domains results in a multi-dimensional fuzzy set.

Example: $A_1 \cap A_2$ on $X_1 \times X_2$:

R. Babuska, Delft Center for Systems and Control, SC0081

46

Intersection on Cartesian Product Space

An operation between fuzzy sets are defined in different domains results in a multi-dimensional fuzzy set.

Example: $A_1 \cap A_2$ on $X_1 \times X_2$:

R. Babuska, Delft Center for Systems and Control, SC0081

47

Fuzzy Relations

Classical relation represents the presence or absence of interaction between the elements of two or more sets.

With **fuzzy relations**, the degree of association (correlation) is represented by membership grades.

An n-dimensional fuzzy relation is a mapping

$$R : X_1 \times X_2 \times X_3 \dots \times X_n \rightarrow [0, 1]$$

which assigns membership grades to all n-tuples (x_1, x_2, \dots, x_n) from the Cartesian product universe.

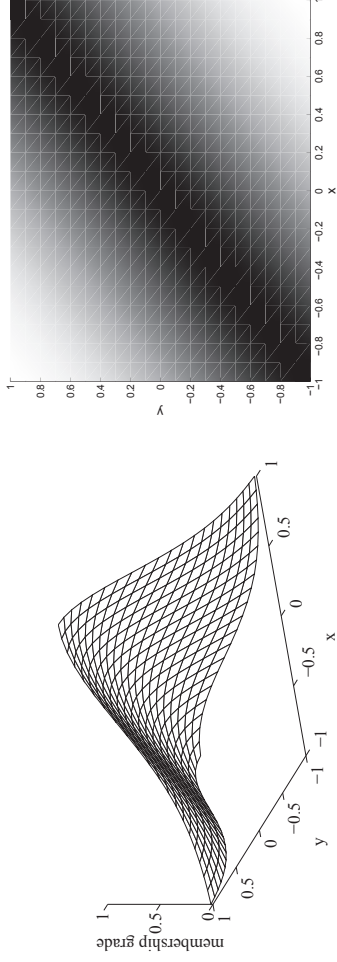

R. Babuska, Delft Center for Systems and Control, SC0081

48

Fuzzy Relations: Example

Example: $R : x \approx y$ (“ x is approximately equal to y ”)

$$\mu_R(x, y) = e^{-(x-y)^2}$$

Relational Composition

Given fuzzy relation R defined in $X \times Y$ and fuzzy set A defined in X , derive the corresponding fuzzy set B defined in Y :

$$B = A \circ R = \text{proj}_Y(\text{ext}_{X \times Y}(A) \cap R)$$

max-min composition:

$$\mu_B(y) = \max_x \min(\mu_A(x), \mu_R(x, y))$$

Analogous to evaluating a function.

Graphical Interpretation: Crisp Function

Graphical Interpretation: Interval Function

Graphical Interpretation: Fuzzy Relation

Max-Min Composition: Example

$$\mu_B(y) = \max_x \min(\mu_A(x), \mu_R(x, y)), \quad \forall y$$

$$\begin{bmatrix} 1.0 & 0.4 & 0.1 & 0.0 & 0.0 \\ 0.0 & 0.0 & 0.0 & 0.4 & 0.8 \\ 0.0 & 0.1 & 1.0 & 0.2 & 0.0 \\ 0.0 & 1.0 & 0.0 & 0.0 & 0.0 \\ 0.0 & 0.9 & 0.0 & 0.0 & 0.0 \\ 0.0 & 0.0 & 0.8 & 0.3 & 0.0 \end{bmatrix} \circ \begin{bmatrix} 0.0 & 0.0 & 0.0 & 0.4 & 0.8 \\ 0.0 & 0.1 & 1.0 & 0.2 & 0.0 \\ 0.0 & 1.0 & 0.0 & 0.0 & 0.0 \\ 0.0 & 0.9 & 0.0 & 0.0 & 0.0 \\ 0.0 & 0.0 & 0.8 & 0.3 & 0.0 \end{bmatrix} = \begin{bmatrix} 0.0 & 0.1 & 0.4 & 0.4 & 0.8 \end{bmatrix}$$

Fuzzy Systems

- **Systems with fuzzy parameters**

$$y = \tilde{3}x_1 + \tilde{5}x_2$$

- **Fuzzy inputs and states**

$$\dot{x}(t) = Ax(t) + Bu(t), \quad x(0) = \tilde{2}$$

- **Rule-based systems**

If the heating power is high
then the temperature will increase fast

Rule-based Fuzzy Systems

- Linguistic (Mamdani) fuzzy model

If x is A then y is B

- Fuzzy relational model

If x is A then y is $B_1(0.1), B_2(0.8)$

- Takagi–Sugeno fuzzy model

If x is A then $y = f(x)$

Linguistic Model

If x is A then y is B

x is A – antecedent (fuzzy proposition)

y is B – consequent (fuzzy proposition)

Linguistic Model

If x is A then y is B

x is A – antecedent (fuzzy proposition)

y is B – consequent (fuzzy proposition)

Compound propositions (logical connectives, hedges):

If x_1 is very big **and** x_2 is **not** small

Multidimensional Antecedent Sets

$A_1 \cap A_2$ on $X_1 \times X_2$:

Partitioning of the Antecedent Space

conjunctive

other connectives

Inference Mechanism

Given the if-then rules and an input fuzzy set, deduce the corresponding output fuzzy set.

- Formal approach based on fuzzy relations.
- Simplified approach (Mamdani inference).
- Interpolation (additive fuzzy systems).

Formal Approach

1. Represent each if-then rule as a fuzzy relation.
2. Aggregate these relations in one relation representative for the entire rule base.
3. Given an input, use *relational composition* to derive the corresponding output.

Modus Ponens Inference Rule

Classical logic

if x is A then y is B
 x is A _____
 y is B

Fuzzy logic

if x is A then y is B
 x is A' _____
 y is B'

Relational Representation of Rules

If-then rules can be represented as a *relation*, using implications or conjunctions.

Classical implication

A	B	$A \rightarrow B$	$(\neg A \vee B)$
0	0	1	1
0	1	1	1
1	0	0	0
1	1	1	1

A \ B	0	1
0	0	1
1	1	0

$$R: \{0, 1\} \times \{0, 1\} \rightarrow \{0, 1\}$$

Relational Representation of Rules

If-then rules can be represented as a *relation*, using implications or conjunctions.

Conjunction

A	B	$A \wedge B$
0	0	0
0	1	0
1	0	0
1	1	1

A \ B	0	1
0	0	0
1	0	1

$$R: \{0, 1\} \times \{0, 1\} \rightarrow \{0, 1\}$$

Fuzzy Implications and Conjunctions

Fuzzy implication is represented by a fuzzy relation:

$$R: [0, 1] \times [0, 1] \rightarrow [0, 1]$$

$$\mu_R(x, y) = I(\mu_A(x), \mu_B(y))$$

$I(a, b)$ – implication function

“classical” Kleene–Diene $I(a, b) = \max(1 - a, b)$

Lukasiewicz $I(a, b) = \min(1, 1 - a + b)$

T-norms Mamdani $I(a, b) = \min(a, b)$

Larsen $I(a, b) = a \cdot b$

Inference With One Rule

1. Construct implication relation:

$$\mu_R(x, y) = I(\mu_A(x), \mu_B(y))$$

Inference With One Rule

1. Construct implication relation:

$$\mu_R(x, y) = I(\mu_A(x), \mu_B(y))$$

2. Use relational composition to derive B' from A' :

$$B' = A' \circ R$$

Graphical Illustration

$$\mu_R(x, y) = \min(\mu_A(x), \mu_B(y)) \quad \mu_{B'}(y) = \max_x \min(\mu_{A'}(x), \mu_R(x, y))$$

Inference With Several Rules

1. Construct implication relation for each rule i :

$$\mu_{R_i}(x, y) = I(\mu_{A_i}(x), \mu_{B_i}(y))$$

2. Aggregate relations R_i into one:

$$\mu_R(x, y) = \text{aggr}(\mu_{A_i}(x))$$

The aggr operator is the minimum for implications and the maximum for conjunctions.

3. Use relational composition to derive B' from A' :

$$B' = A' \circ R$$

Example: Conjunction

1. Each rule

If \tilde{x} is A_i then \tilde{y} is B_i

is represented as a fuzzy relation on $X \times Y$:

$$R_i = A_i \times B_i \quad \mu_{R_i}(x, y) = \mu_{A_i}(x) \wedge \mu_{B_i}(y)$$

Aggregation and Composition

2. The entire rule base's relation is the union:

$$R = \bigcup_{i=1}^K R_i \quad \mu_R(\mathbf{x}, \mathbf{y}) = \max_{1 \leq i \leq K} [\mu_{R_i}(\mathbf{x}, \mathbf{y})]$$

3. Given an input value A' the output value B' is:

$$B' = A' \circ R \quad \mu_{B'}(\mathbf{y}) = \max_{\mathbf{X}} [\mu_{A'}(\mathbf{x}) \wedge \mu_R(\mathbf{x}, \mathbf{y})]$$

Example: Modeling of Liquid Level

- If F_{in} is **Zero** then h is **Zero**
- If F_{in} is **Med** then h is **Med**
- If F_{in} is **Large** then h is **Med**

\mathcal{R}_1 If Flow is Zero then Level is Zero

\mathcal{R}_2 If Flow is Medium then Level is Medium

\mathcal{R}_3 If Flow is Large then Level is Medium

Aggregated Relation

Simplified Approach

1. Compute the match between the input and the antecedent membership functions (*degree of fulfillment*).
2. Clip the corresponding output fuzzy set for each rule by using the degree of fulfillment.
3. Aggregate output fuzzy sets of all the rules into one fuzzy set.

This is called the *Mamdani* or *max-min* inference method.

Water Tank Example

- If F_{in} is **Zero** then h is **Zero**
- If F_{in} is **Med** then h is **Med**
- If F_{in} is **Large** then h is **Med**

Mamdani Inference: Example

Mamdani Inference: Example

Given a crisp (numerical) input (F_{in}).

If F_{in} is Zero then ...

Determine the degree of fulfillment (truth) of the first rule.

If F_{in} is Zero then h is Zero

Clip consequent membership function of the first rule.

If F_{in} is Medium then ...

Determine the degree of fulfillment (truth) of the second rule.

If F_{in} is Medium then h is Medium

Clip consequent membership function of the second rule.

Aggregation

Combine the result of the two rules (union).

Defuzzification

conversion of a fuzzy set to a crisp value

Center-of-Gravity Method

$$y_0 = \frac{\sum_{j=1}^F \mu_{B'}(y_j) y_j}{\sum_{j=1}^F \mu_{B'}(y_j)}$$

Defuzzification

Compute a crisp (numerical) output of the model (center-of-gravity method).

Fuzzy System Components
