Outline

1. Local design using Takagi–Sugeno models
2. Inverse model control
3. Model-based predictive control
4. Feedback linearization
5. Adaptive control

Considered Settings

- Fuzzy or neural model of the process available
(many of the presented techniques apply to other types of models as well)
- Based on the model, design a controller (off line)
- Use the model explicitly within a controller
- Model fixed or adaptive

TS Model \rightarrow TS Controller

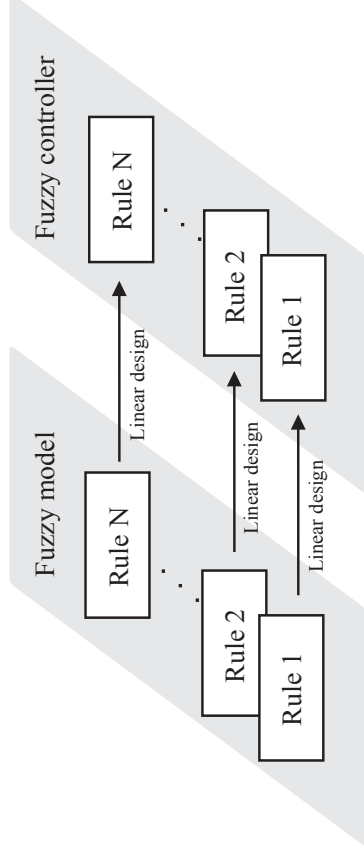

Model:

- If $y(k)$ is Small then $x(k+1) = a_s x(k) + b_s u(k)$
If $y(k)$ is Medium then $x(k+1) = a_m x(k) + b_m u(k)$
If $y(k)$ is Large then $x(k+1) = a_l x(k) + b_l u(k)$

Controller:

- If $y(k)$ is Small then $u(k) = -L_s x(k)$
If $y(k)$ is Medium then $u(k) = -L_m x(k)$
If $y(k)$ is Large then $u(k) = -L_l x(k)$

Design Using a Takagi–Sugeno Model

Apply classical synthesis and analysis methods locally.

Control Design via Lyapunov Method

Model:

$$\text{If } \mathbf{x}(k) \text{ is } \Omega_i \text{ then } \mathbf{x}_i(k+1) = \mathbf{A}_i \mathbf{x}(k) + \mathbf{B}_i \mathbf{u}(k)$$

Controller:

$$\text{If } \mathbf{x}(k) \text{ is } \Omega_i \text{ then } \mathbf{u}_i(k) = -\mathbf{L}_i \mathbf{x}(k)$$

Stability guaranteed if $\exists \mathbf{P} > \mathbf{0}$ such that:

$$(\mathbf{A}_i - \mathbf{B}_i \mathbf{L}_j)^T \mathbf{P} (\mathbf{A}_i - \mathbf{B}_i \mathbf{L}_j) - \mathbf{P} < \mathbf{0}, \quad i, j = 1, \dots, K$$

TS Model is a Polytopic System

$$\mathbf{x}(k+1) = \left(\sum_{i=1}^K \sum_{j=1}^K \gamma_i \gamma_j (\mathbf{A}_i - \mathbf{B}_i \mathbf{L}_j) \right) \mathbf{x}(k)$$

Inverse Control (Feedforward)

Process model: $y(k+1) = f(\mathbf{x}(k), u(k))$, where

$$\mathbf{x}(k) = [y(k), \dots, y(k - n_y + 1), u(k - 1), \dots, u(k - n_u + 1)]^T$$

Controller: $u(k) = f^{-1}(\mathbf{x}(k), r(k+1))$

When is Inverse-Model Control Applicable?

1. Process (model) is stable and invertible
2. The inverse model is stable
3. Process model is accurate (enough)
4. Little influence of disturbances
5. In combination with feedback techniques

R. Babuska, Delft Center for Systems and Control, SC0081

9

How to invert $f(\cdot)$?

1. Numerically (general solution, but slow):

$$J(u(k)) = [r(k+1) - f(\mathbf{x}(k), u(k))]^2$$

minimize w.r.t. $\mathbf{u}(k)$

2. Analytically (for some special forms of $f(\cdot)$ only):
 - affine in $u(k)$
 - singleton fuzzy model
3. Construct inverse model directly from data

R. Babuska, Delft Center for Systems and Control, SC0081

10

Inverse of an Affine Model

affine model:

$$y(k+1) = g(\mathbf{x}(k)) + h(\mathbf{x}(k)) \cdot u(k)$$

express $u(k)$:

$$u(k) = \frac{y(k+1) - g(\mathbf{x}(k))}{h(\mathbf{x}(k))}$$

substitute $r(k+1)$ for $y(k+1)$

necessary condition $h(\mathbf{x}) \neq 0$ for all \mathbf{x} of interest

R. Babuska, Delft Center for Systems and Control, SC0081

11

Example: Affine Neural Network

R. Babuska, Delft Center for Systems and Control, SC0081

12

Example: Affine TS Fuzzy Model

\mathcal{R}_i : If $y(k)$ is A_{i1} and ... and $y(k - n_y + 1)$ is A_{iny} and $u(k - 1)$ is B_{i2} and ... and $u(k - n_u + 1)$ is B_{inu} then

$$y_i(k+1) = \sum_{j=1}^{n_y} a_{ij} y(k-j+1) + \sum_{j=1}^{n_u} b_{ij} u(k-j+1) + c_i,$$

$$y(k+1) = \sum_{i=1}^K \gamma_i(\mathbf{x}(k)) \left[\sum_{j=1}^{n_y} a_{ij} y(k-j+1) + \sum_{j=2}^{n_u} b_{ij} u(k-j+1) + c_i \right] + \sum_{i=1}^K \gamma_i(\mathbf{x}(k)) b_{i1} u(k)$$

How to obtain \mathbf{x} ?

inverse model: $u(k) = f^{-1}(\mathbf{x}(k), r(k+1))$

1. Use the prediction model: $\hat{y}(k+1) = f(\hat{\mathbf{x}}(k), u(k))$

$$\hat{\mathbf{x}}(k) = [\hat{y}(k), \dots, \hat{y}(k - n_y + 1), u(k-1), \dots, u(k - n_u + 1)]^T$$

Open-loop feedforward control

2. Use measured process output

$$\mathbf{x}(k) = [y(k), \dots, y(k - n_y + 1), u(k-1), \dots, u(k - n_u + 1)]^T$$

Open-loop feedback control

Learning Inverse (Neural) Model

Open-Loop Feedforward Control

- Always stable (for stable processes)
- No way to compensate for disturbances

Open-Loop Feedback Control

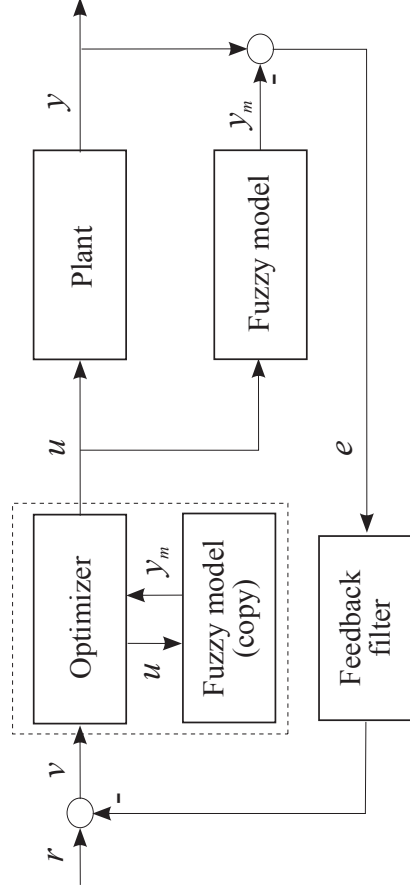

- Can to some degree compensate disturbances
- Can become unstable

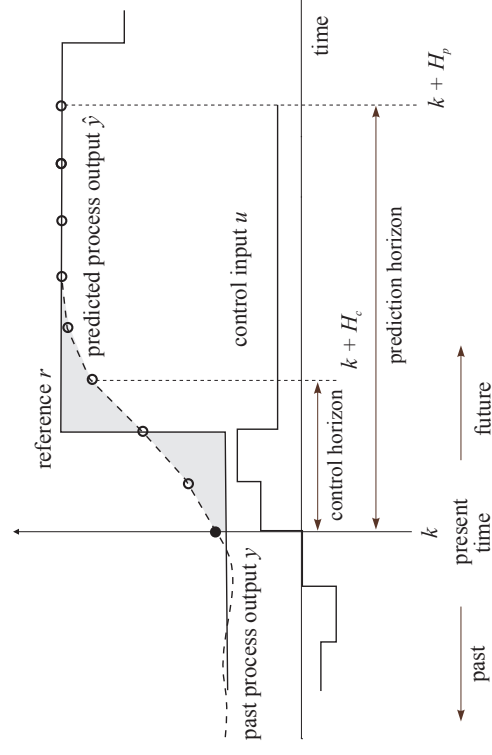

Internal Model Control

Model-Based Predictive Control

Model-Based Predictive Control

Objective Function and Constraints

$$J = \sum_{i=1}^{H_p} \|(\mathbf{r}(k+i) - \hat{\mathbf{y}}(k+i))\|_{P_i}^2 + \sum_{i=1}^{H_c} \|(\mathbf{u}(k+i) - \mathbf{u}(k))\|_{Q_i}^2$$

$$\hat{\mathbf{y}}(k+1) = f(\hat{\mathbf{x}}(k), \mathbf{u}(k))$$

$$\mathbf{u}^{\min} \leq \mathbf{u} \leq \mathbf{u}^{\max}$$

$$\Delta \mathbf{u}^{\min} \leq \Delta \mathbf{u} \leq \Delta \mathbf{u}^{\max}$$

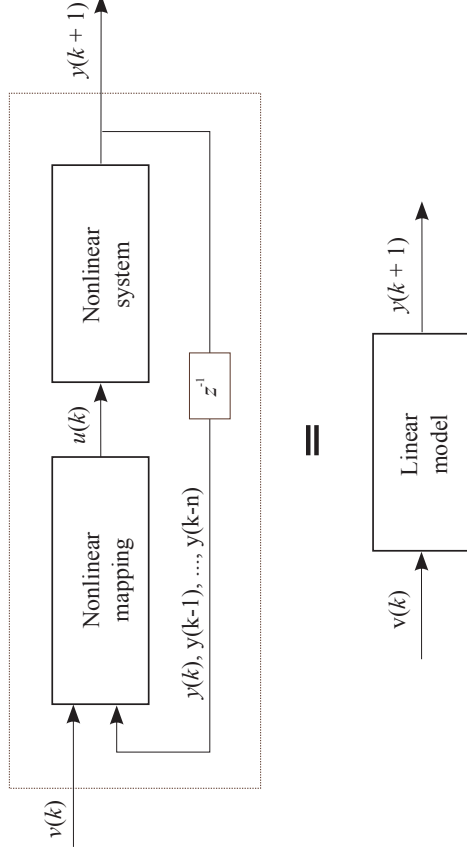

$$\mathbf{y}^{\min} \leq \mathbf{y} \leq \mathbf{y}^{\max}$$

$$\Delta \mathbf{y}^{\min} \leq \Delta \mathbf{y} \leq \Delta \mathbf{y}^{\max}$$

Feedback linearization

22

R. Babuška, Delft Center for Systems and Control, SC4081

Feedback Linearization (continued)

given affine system: $y(k+1) = g(\mathbf{x}(k)) + h(\mathbf{x}(k)) \cdot u(k)$

express $u(k)$:

$$u(k) = \frac{y(k+1) - g(\mathbf{x}(k))}{h(\mathbf{x}(k))}$$

substitute $A(q)y(k) + B(q)v(k)$ for $y(k+1)$:

$$u(k) = \frac{A(q)y(k) + B(q)v(k) - g(\mathbf{x}(k))}{h(\mathbf{x}(k))}$$

23

R. Babuška, Delft Center for Systems and Control, SC4081

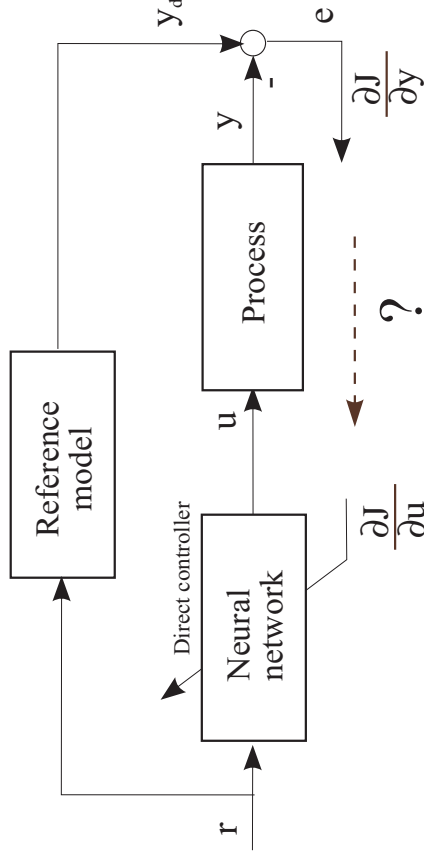

Adaptive Control

- Model-based techniques (use explicit process model):
 - model reference control through backpropagation
 - indirect adaptive control
- Model-free techniques (no explicit model used)
 - reinforcement learning

24

R. Babuška, Delft Center for Systems and Control, SC4081

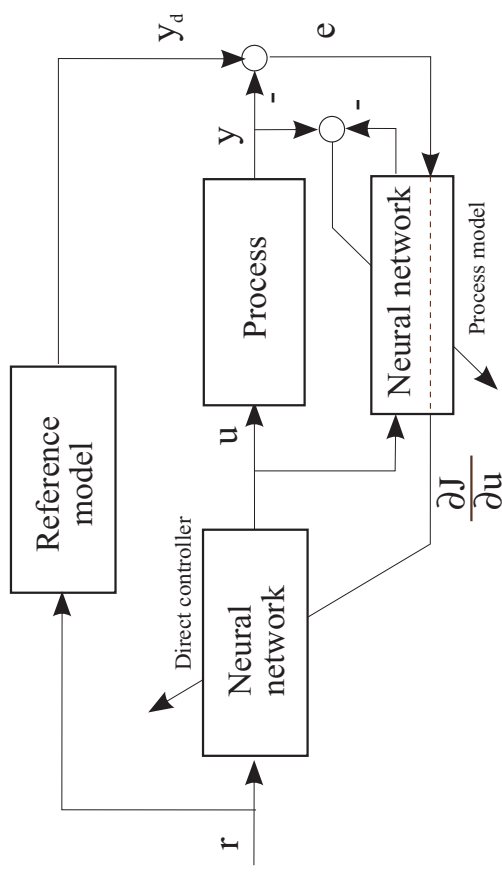

Model Reference Adaptive Neurocontrol

R. Babuska, Delft Center for Systems and Control, SC0081

25

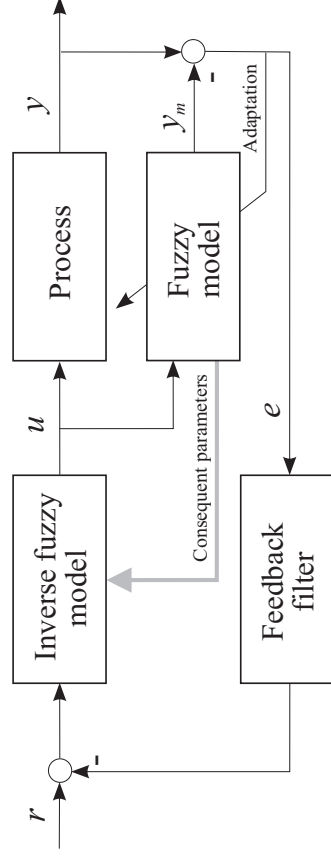

Model Reference Adaptive Neurocontrol

R. Babuska, Delft Center for Systems and Control, SC0081

26

Indirect Adaptive Control

no only for fuzzy models, but also for affine NNs, etc.

R. Babuska, Delft Center for Systems and Control, SC0081

27

Reinforcement Learning

- Inspired by principles of human and animal learning.
- No explicit model of the process used.
- No detailed feedback, only reward (or punishment).
- A control strategy can be learnt from scratch.

R. Babuska, Delft Center for Systems and Control, SC0081
