

Optimization: MATLAB Optimization Toolbox

MATLAB Optimization Toolboxes

Optimization Toolbox

- linear programming: `linprog`, `intlinprog`
- quadratic programming: `quadprog`
- unconstrained minimization: `fminunc`, `fminsearch`
- nonlinear least squares: `lsqnonlin`
- constrained minimization: `fmincon`

Global Optimization Toolbox

- genetic algorithm: `ga`
- simulated annealing: `simulannealbnd`

Other toolboxes: NAG, OSL, minpack, MINOS, LANCELOT, ...

See also: Decision Tree for Optimization Software

<https://plato.la.asu.edu/guide.html>

Linear programming

Linear programming: `linprog`

$$\min_x c^T x \quad \text{subject to: } Ax \leq b, \quad A_{\text{eq}}x = b_{\text{eq}}$$

Implements simplex or interior point method

```
x=linprog(c,A,b,Aeq,beq,lb,ub,x0,options)
```

Lower and upper bounds: $lb \leq x \leq ub$

Initial guess: `x0`

Options: `options`

- `optimoptions('linprog','Algorithm','interior-point')`
- `optimoptions('linprog','Display','iter')` but ...
- `optimoptions('linprog','MaxIterations',100)` but ...

Smartphone manufacturing problem

$$\begin{aligned} \min_{x_1, x_2} \quad & -20x_1 - 30x_2 \\ \text{s.t.} \quad & x_1 + x_2 \leq 100 \\ & 0.1x_1 + 0.2x_2 \leq 14 \\ & x_1, x_2 \geq 0 \end{aligned}$$

```
>> c=[-20 -30];  
>> A=[ 1 1;0.1 0.2];  
>> b=[100 14]';  
>> lb=[0 0]';  
>> ub=[Inf Inf]';  
>> [x,fval,exitflag]=linprog(c,A,b,[],[],lb,ub)  
x =  
    60  
    40
```

Linear programming – Output arguments

`[x,fval,exitflag,output]=linprog(...)`

- `fval`: optimal value of the objective function
- `exitflag`
 - > 0 : converged to solution
 - = 0 : maximum number of iterations exceeded
 - < 0 : algorithm did not find bounded optimal / feasible solution→ use this information and always check value of `exitflag`!
- `output.iterations`: number of iterations

Integer linear programming

Integer linear programming: `intlinprog`

$$\min_x c^T x \quad \text{subject to: } Ax \leq b, \quad A_{\text{eq}}x = b_{\text{eq}}$$

with $x(i)$ integer for $i \in \text{intcon}$

Implements branch-and-bound algorithm

```
x=linprog(c,intcon,A,b,Aeq,beq,lb,ub,x0,options)
```

For more info use

```
help intlinprog
```

or — for extended information —:

```
doc intlinprog
```

Quadratic programming

Quadratic programming: quadprog

$$\min_x \frac{1}{2}x^T Hx + c^T x \quad \text{subject to: } Ax \leq b, \quad A_{\text{eq}}x = b_{\text{eq}}$$

Variant of modified simplex or interior-point method

```
x=quadprog(H,c,A,b,Aeq,Beq,lb,ub,x0,options)
```

Lower and upper bounds: $lb \leq x \leq ub$

Initial guess: x0

Options: options

- optimoptions('quadprog','Algorithm','active-set')
- optimoptions('quadprog',...
 'Algorithm','trust-region-reflective')
- optimoptions('quadprog','MaxIterations',100) but ...

Quadratic programming – Output arguments

`[x,fval,exitflag,output]=quadprog(...)`

- `fval`: optimal value of the objective function
- `exitflag`
 - > 0 : converged to solution
 - = 0 : maximum number of iterations exceeded
 - < 0 : algorithm did not converge/did not find an optimal solution→ use this information and always check value of `exitflag`!
- `output.iterations`: number of iterations

System identification example

ARX model:

$$y(n+1) + ay(n) = bu(n) + e(n)$$

Given: $u(1), \dots, u(4)$ and $y(1), \dots, y(5)$

Find estimates $\hat{a}$ and $\hat{b}$ of a and b

$$\underbrace{\begin{bmatrix} \hat{e}(1) \\ \hat{e}(2) \\ \hat{e}(3) \\ \hat{e}(4) \end{bmatrix}}_E = \underbrace{\begin{bmatrix} y(2) \\ y(3) \\ y(4) \\ y(5) \end{bmatrix}}_Y - \underbrace{\begin{bmatrix} -y(1) & u(1) \\ -y(2) & u(2) \\ -y(3) & u(3) \\ -y(4) & u(4) \end{bmatrix}}_{\Phi} \underbrace{\begin{bmatrix} \hat{a} \\ \hat{b} \end{bmatrix}}_x$$

System identification example (2)

$$\begin{aligned}\min_x E^T E &= \min_x (Y - \Phi x)^T (Y - \Phi x) \\ &= \min_x x^T \Phi^T \Phi x - 2Y^T \Phi x + Y^T Y = \min_x \frac{1}{2} x^T H x + c^T x\end{aligned}$$

subject to

$$-0.99 \leq \hat{a} \leq 0.99$$

```
>> H=[10.1370 1.7334;1.7334 1.5364];  
>> c=[-8.6306 -3.9850]';  
>> lb=[-0.99 -Inf]';  
>> ub=[ 0.99  Inf]';  
>> x0=[0 0]';  
>> o=optimoptions('quadprog','Algorithm','active-set');  
>> x=quadprog(H,c,[],[],[],[],lb,ub,x0,o)  
x =  
    0.5054  
    2.0236
```

Model Predictive Control (MPC) example

Plant:

$$x(k+1) = Ax(k) + Bu(k)$$

$$y(k) = Cx(k)$$

Objectives:

- Steer the output $y(k)$ to zero
- Keep the control effort $u(k)$ small

Assumption: all states are measurable

MPC example (2)

Performance index:

$$J(k) = \sum_{i=1}^{N_p} y^2(k+i|k) + \lambda u^2(k+i-1|k)$$

Optimization problem:

$$\min_{u(k|k), \dots, u(k+N_p-1|k)} J(k)$$

$$\text{s.t. } |u(k+i-1|k)| \leq 0.25 \quad \text{for } i = 1, 2, \dots, N_p$$

Receding Horizon

Every time step, only $u(k|k)$ is applied, model/state is updated, and prediction window is shifted

We need **predictions of output** y at sample steps $k+i$, $i = 1, \dots, N_p$

MPC example (3)

$$\begin{bmatrix} x(k+1|k) \\ \vdots \\ x(k+N_p|k) \end{bmatrix} = \begin{bmatrix} A \\ \vdots \\ A^{N_p} \end{bmatrix} x(k) + \begin{bmatrix} B & 0 & \cdots & 0 \\ AB & B & & 0 \\ \vdots & & \ddots & \vdots \\ A^{N_p-1}B & \cdots & B \end{bmatrix} \begin{bmatrix} u(k|k) \\ \vdots \\ u(k+N_p-1|k) \end{bmatrix}$$

$$\begin{bmatrix} y(k+1|k) \\ \vdots \\ y(k+N_p|k) \end{bmatrix} = \begin{bmatrix} C & 0 & \cdots & 0 \\ 0 & C & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & C \end{bmatrix} \begin{bmatrix} x(k+1|k) \\ \vdots \\ x(k+N_p|k) \end{bmatrix}$$

$$\tilde{x} = \tilde{A}x(k) + \tilde{B}\tilde{u}$$

$$\tilde{y} = \tilde{C}\tilde{x} = \tilde{C}\tilde{A}x(k) + \tilde{C}\tilde{B}\tilde{u}$$

$\tilde{y}$ affine function of $\tilde{u}$
 quadratic objective $\tilde{y}^T \tilde{y} + \lambda \tilde{u}^T \tilde{u}$
 linear constraints

$\left. \begin{array}{l} \text{quadratic objective } \tilde{y}^T \tilde{y} + \lambda \tilde{u}^T \tilde{u} \\ \text{linear constraints} \end{array} \right\} \Rightarrow \text{quadratic programming problem}$

Unconstrained nonlinear optimization

Unconstrained nonlinear optimization: `fminsearch`, `fminunc`

$$\min_x f(x)$$

- Nelder-Mead method

```
x=fminsearch(@fun,x0,options)
```

- Direction determination and line search

```
x=fminunc(@fun,x0,options)
```

with `fun.m` m-file that defines f and its gradient g (optional):

```
[f,g]=fun(x)
f=...
% Compute gradient if required.
if ( nargout > 1 )
    g=...
end;
```

fminunc — @ notation for functions

More complex example: specifying, e.g., parameters a and b

```
x=fminunc(@(x)fun(x,a,b),x0,options)
```

```
% Main code
```

```
...
```

```
a=2;
```

```
b=5;
```

```
x=fminunc(@(x)fun(x,a,b),x0,options);
```

```
[f,g]=fun(x,a,b)
```

```
f=...
```

```
% Compute gradient if required.
```

```
if ( nargout > 1 )
```

```
    g=...
```

```
end;
```

fminunc — Main options

Set `options` with `options=optimoptions('fminunc',...,...)`

- `'Algorithm'`: selects algorithm, e.g., quasi-newton
- `'Display'`: controls display of intermediate values
- `'SpecifyObjectiveGradient'`: indicates whether gradient is defined by user
- `'MaxFunctionEvaluations'`: maximum number of function evaluations
- `'MaxIterations'`: maximum number of iterations
- `'OptimalityTolerance'`: termination tolerance on gradient of f
- `'StepTolerance'`: termination tolerance on x
- `'CheckGradients'`: compare user-supplied gradient with finite-difference derivatives but ...

fminunc — Output arguments

```
[x,fval,exitflag,output]=fminunc(...)
```

- `exitflag`
 - > 0 : converged to solution
 - = 0 : maximum number of function evaluations or iterations exceeded
 - < 0 : algorithm did not converge→ use this information and always check value of `exitflag`!
- `output.funcCount`: number of function evaluations
`output.iterations`: number of iterations

Nonlinear least squares

$$f(x) = e^T(x)e(x)$$

$$\nabla f(x) = 2\nabla e(x)e^T(x)$$

$$H(x) = 2\nabla e(x)\nabla^T e(x) + \sum_{i=1}^N 2\nabla^2 e_i(x)e_i(x)$$

Approximation of the Hessian:

$$\hat{H}(x) := 2\nabla e(x)\nabla^T e(x)$$

Levenberg-Marquardt method:

$$x_{i+1} = x_i - \left(\lambda I + \hat{H}(x_i) \right)^{-1} \nabla f(x_i) s_i$$

Unconstrained nonlinear least squares

Unconstrained nonlinear least squares: `lsqnonlin`

$$\min_x e^T(x)e(x)$$

```
x=lsqnonlin(@fun,x0,lb,ub,options)
```

fun should return **full vector** $e(x)$, not just $e^T(x)e(x)$!

```
options=optimoptions('lsqnonlin',...,...)
```

- 'Algorithm':
 'levenberg-marquardt': Levenberg-Marquardt
- 'SpecifyObjectiveGradient': use user-defined gradient/Jacobian

Neural network example

Neural network equations:

$$v_j(k) = \sum_{i=1}^{N^i} w_{ij}^h \phi_i(k) + b_j^h$$

$$\hat{y}(k) = \sum_{j=1}^{N^h} w_j^o \tanh(v_j(k)) + b^o \quad \text{with } \tanh(x) = \frac{e^x - e^{-x}}{e^x + e^{-x}}$$

Matrix notation: $V = \Phi W^h + U_N B^h$

$$\hat{Y} = \tanh(V) W^o + U_N b^o$$

Neural network example (2)

Identification of a nonlinear plant:

$$y(k+1) = \frac{y(k)}{1+y^2(k)} + u^3(k)$$

Neural network model: $\hat{y}(k) = f(\phi(k))$

$$\phi(k) = \begin{bmatrix} u(k-1) & y(k-1) \end{bmatrix}$$

Model error:

$$e(k) := y(k) - \hat{y}(k)$$

Nonlinear least squares problem

$$\min_{W^h, W^o, B^h, b^o} \sum_{k=1}^N |e(k)|^2$$

→ `lsqnonlin`

Constrained nonlinear optimization

Constrained nonlinear optimization: `fmincon`

$$\min_x f(x), \quad \text{subject to } h(x) = 0 \text{ and } g(x) \leq 0$$

Sequential Quadratic Programming

```
x=fmincon(@fun,x0,A,b,Aeq,beq,lb,ub,@nonlcon,options)
```

Lower and upper bounds: $lb \leq x \leq ub$

Linear constraints: $A x \leq b$, $Aeq x = beq$

Nonlinear constraints: $c(x) \leq 0$, $ceq(x) = 0$

```
[c,ceq,Jc,Jceq]=nonlcon(x)
```

```
options=optimoptions('fmincon',...,...)
```

- **'Algorithm': 'sqp'** → SQP

fmincon — Gradient and Jacobian

→ make sure to put the options 'SpecifyObjectiveGradient' and 'SpecifyConstraintGradient' to true!

```
[f,g]=fun(x)
f=...
% Compute gradient if required.
if ( nargout > 1 )
    g=...
end;

[c,ceq,Jc,Jceq]=nonlcon(x)
c=...
ceq=...
% Compute TRANPOSED Jacobians if required.
if ( nargout > 2 )
    Jc=...
    Jceq=...
end;
```

Genetic algorithm

Genetic algorithm: `ga`

$$\min_x f(x), \quad \text{subject to } h(x) = 0 \text{ and } g(x) \leq 0$$

Genetic algorithm:

```
x=ga(f,nvars,A,b,Aeq,beq,lb,ub,nonlcon,options)
```

Lower and upper bounds: $lb \leq x \leq ub$

Linear constraints: $A x \leq b$, $Aeq x = beq$

Nonlinear constraints: $c(x) \leq 0$, $ceq(x) = 0$

```
[c,ceq]=nonlcon(x)
```

Set options using `optimoptions`

```
e.g., options=optimoptions('ga','MaxGenerations',50)
```

Simulated annealing

Simulated annealing: `simulannealbnd`

$$\min_x f(x), \quad \text{subject to } x_{lb} \leq x \leq x_{ub}$$

Simulated annealing:

```
x=simulannealbnd(@fun,x0,lb,ub,options)
```

Lower and upper bounds: $lb \leq x \leq ub$

Set options using `optimoptions`

```
e.g., options=optimoptions('simulannealbnd',...  
                             'InitialTemperature',50)
```

Summary

- Overview of main functions of Matlab Optimization Toolbox and of the Global Optimization Toolbox
- Main options and caveats
