Outline

1. Singleton and Takagi–Sugeno fuzzy system.
2. Dynamic fuzzy systems.
3. Knowledge based fuzzy modeling.
4. Data-driven construction.

R. Babuška, Delft Center for Systems and Control, SC4081

2

Singleton Fuzzy Model

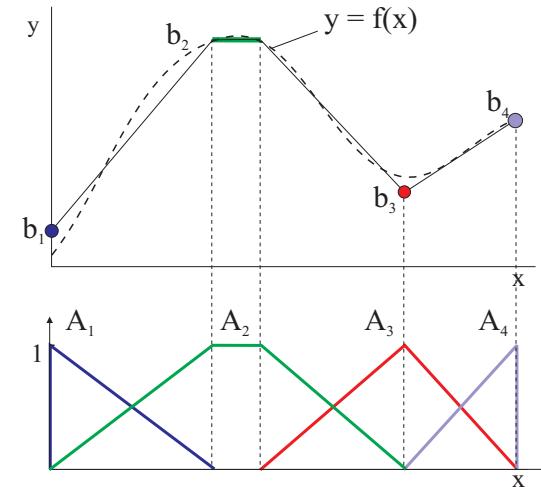

If x is A_i then $y = b_i$

Inference/defuzzification:

$$y = \frac{\sum_{i=1}^K \mu_{A_i}(x) b_i}{\sum_{i=1}^K \mu_{A_i}(x)}$$

- well-understood approximation properties
- straightforward parameter estimation

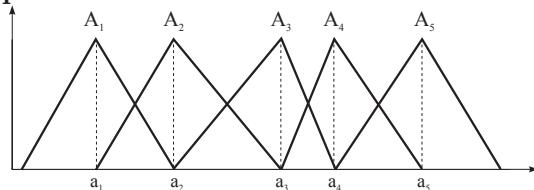

Piece-wise Linear Approximation

Linear Mapping with a Singleton Model

$$y = \mathbf{k}^T \mathbf{x} + q = \sum_{j=1}^p k_j x_j + q$$

- Triangular partition:

- Consequent singletons are equal to:

$$b_i = \sum_{j=1}^p k_j a_{i,j} + q$$

R. Babuška, Delft Center for Systems and Control, SC4081

5

Takagi–Sugeno (TS) Fuzzy Model

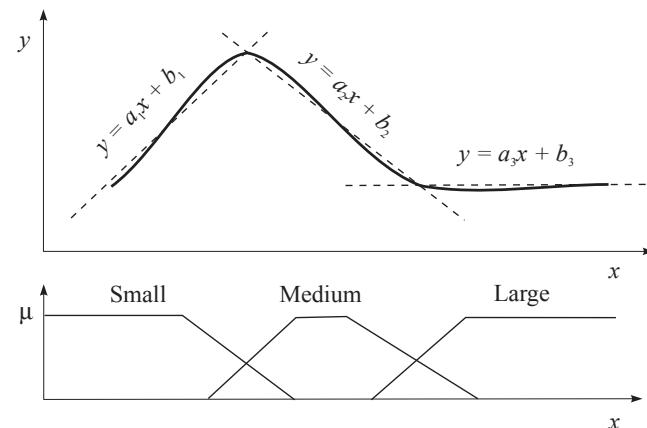

If x is A_i then $y_i = a_i x + b_i$

$$y = \frac{\sum_{i=1}^K \mu_{A_i}(x) y_i}{\sum_{i=1}^K \mu_{A_i}(x)} = \frac{\sum_{i=1}^K \mu_{A_i}(x) (a_i x + b_i)}{\sum_{i=1}^K \mu_{A_i}(x)}$$

R. Babuška, Delft Center for Systems and Control, SC4081

6

Input-Output Mapping of the TS Model

Consequents are approximate local linear models of the system.

R. Babuška, Delft Center for Systems and Control, SC4081

7

TS Model is a Quasi-Linear System

$$y = \frac{\sum_{i=1}^K \mu_{A_i}(\mathbf{x}) y_i}{\sum_{j=1}^K \mu_{A_j}(\mathbf{x})} = \frac{\sum_{i=1}^K \mu_{A_i}(\mathbf{x}) (\mathbf{a}_i^T \mathbf{x} + b_i)}{\sum_{j=1}^K \mu_{A_j}(\mathbf{x})}$$

R. Babuška, Delft Center for Systems and Control, SC4081

8

TS Model is a Quasi-Linear System

$$y = \frac{\sum_{i=1}^K \mu_{A_i}(\mathbf{x}) y_i}{\sum_{j=1}^K \mu_{A_j}(\mathbf{x})} = \frac{\sum_{i=1}^K \mu_{A_i}(\mathbf{x})(\mathbf{a}_i^T \mathbf{x} + b_i)}{\sum_{j=1}^K \mu_{A_j}(\mathbf{x})}$$

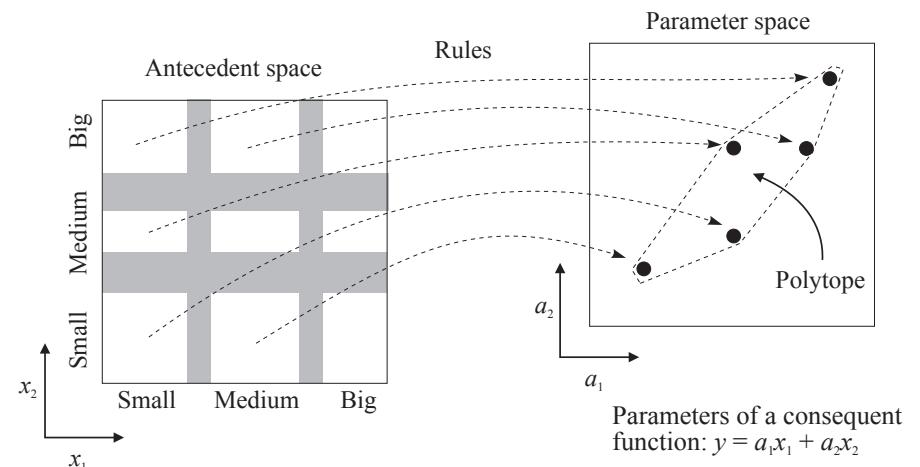

$$y = \underbrace{\left(\sum_{i=1}^K \gamma_i(\mathbf{x}) \mathbf{a}_i^T \right) \mathbf{x}}_{\mathbf{a}(\mathbf{x})} + \underbrace{\sum_{i=1}^K \gamma_i(\mathbf{x}) b_i}_{\mathbf{b}(\mathbf{x})}$$

linear in parameters a_i and b_i , pseudo-linear in \mathbf{x} (LPV)

R. Babuška, Delft Center for Systems and Control, SC4081

9

TS Model is a Polytopic System

R. Babuška, Delft Center for Systems and Control, SC4081

10

Modeling of Dynamic Systems

Nonlinear regression model:

$$\hat{y}(k+1) = F[y(k), \dots, y(k-n_y+1), u(k), \dots, u(k-n_u+1)]$$

In rule-based form (example TS model):

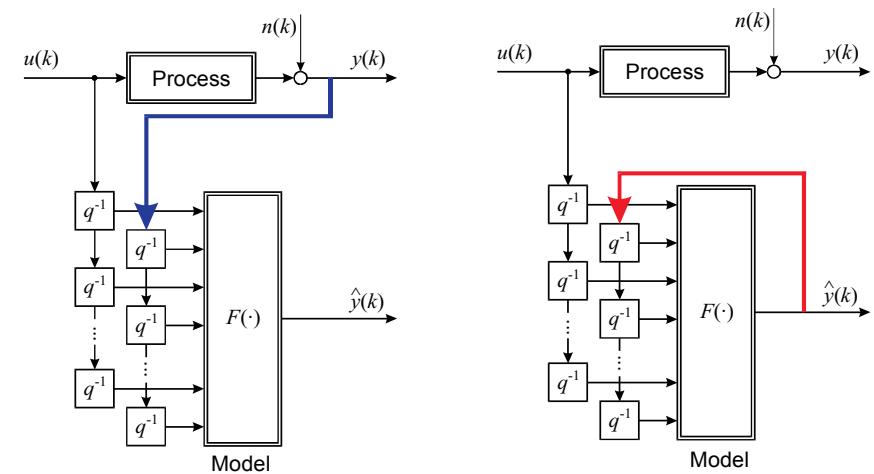

If $y(k)$ is Small and $u(k)$ is Large

$$\text{then } \hat{y}(k+1) = \sum_{j=1}^{n_y} a_{ij} y(k-j+1) + \sum_{j=1}^{n_u} b_{ij} u(k-j+1) + c_i$$

R. Babuška, Delft Center for Systems and Control, SC4081

11

One-Step-Ahead Prediction vs. Simulation

R. Babuška, Delft Center for Systems and Control, SC4081

12

Modeling Paradigms

- **Mechanistic** (white-box, physical)
- **Qualitative** (naive physics, knowledge-based)
- **Data-driven** (black-box, inductive)

Often combination of different approaches semi-mechanistic, gray-box modeling.

Construction of Fuzzy Models

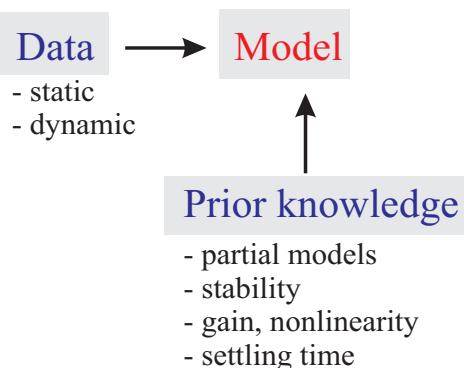

Parameterization of nonlinear models

- polynomials, splines
- look-up tables
- fuzzy systems
- neural networks
- (neuro-)fuzzy systems
- radial basis function networks
- wavelet networks
- ...

Modeling of Complex Systems

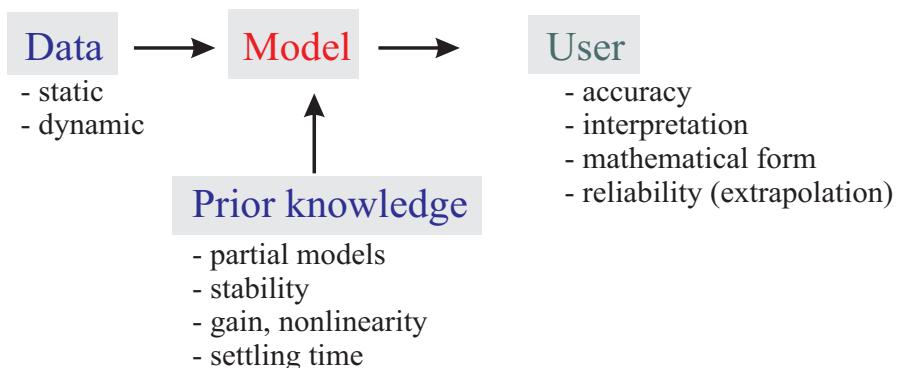

Modeling of Complex Systems

R. Babuška, Delft Center for Systems and Control, SC4081

17

Modeling of Complex Systems

R. Babuška, Delft Center for Systems and Control, SC4081

18

Building Fuzzy Models

Knowledge-based approach:

- expert knowledge → rules & membership functions
- fuzzy model of human operator
- linguistic interpretation

R. Babuška, Delft Center for Systems and Control, SC4081

19

Building Fuzzy Models

Knowledge-based approach:

- expert knowledge → rules & membership functions
- fuzzy model of human operator
- linguistic interpretation

Data-driven approach:

- nonlinear mapping, universal approximation
- extract rules & membership functions from data

R. Babuška, Delft Center for Systems and Control, SC4081

20

Knowledge-Based Modeling

- Problems where little or no data are available.
- Similar to expert systems.
- Presence of both quantitative and qualitative variables or parameters.

Typical applications: fuzzy control and decision support, but also modeling of poorly understood processes

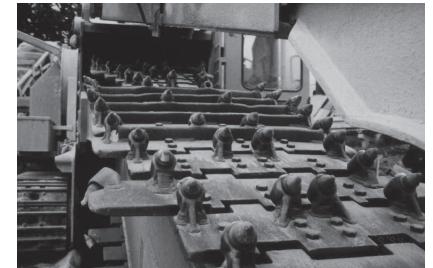

Why Knowledge-Based Modeling?

- Interaction between tool and environment is complex, dynamic and highly nonlinear, rigorous mathematical models are not available.
- Little data (15 data points) to develop statistical regression models.
- Input data are a mixture of numerical measurements (rock strength, joint spacing, trench dimensions) and qualitative information (joint orientation).
- Precise numerical output not needed, qualitative assessment is sufficient.

Wear Prediction for a Trencher

Trencher T-850 (Vermeer)

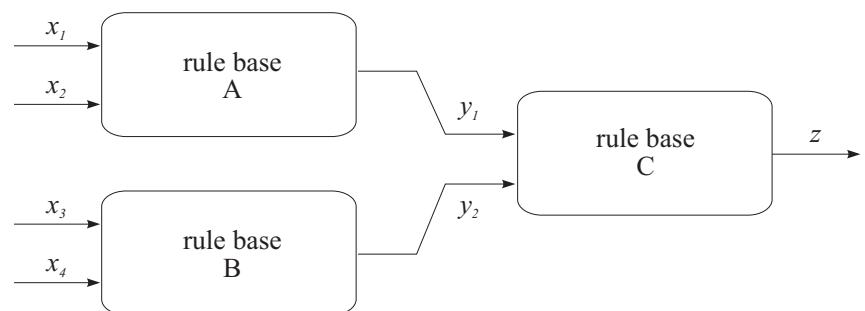

Chain Detail

Goal: Given the terrain properties, predict bit wear and production rate of trencher.

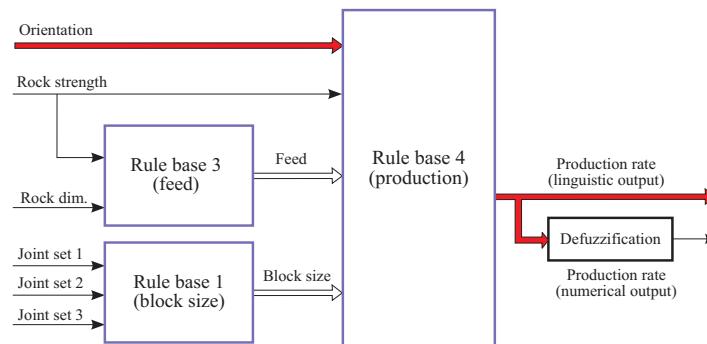

Dimensionality Problem: Hierarchical Structure

Assume 5 membership functions for each input

625 rules in a flat rule base vs. 75 rules in a hierarchical one

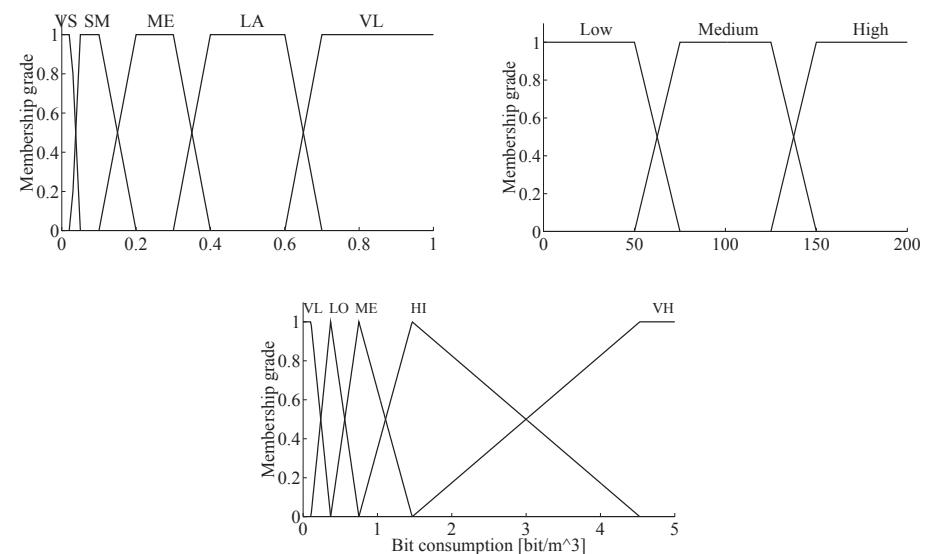

Trencher: Fuzzy Rule Bases

If TRENCH-DIM is SMALL and STRENGTH is LOW Then FEED is VERY-HIGH;
 If TRENCH-DIM is SMALL and STRENGTH is MEDIUM Then FEED is HIGH;

 If JOINT-SP is EXTRA-LARGE and FEED is VERY-HIGH Then PROD is VERY-HIGH

Example of Membership Functions

Output: Prediction of Production Rate

data no.	measured value	predicted linguistic value(s)	
<hr/>			
1	2.07	VERY-LOW	1.00
2	5.56	HIGH	1.00
3	23.60	VERY-HIGH	0.50
4	11.90	HIGH	0.40 VERY-HIGH 0.60
5	7.71	MEDIUM	1.00
6	7.17	LOW	0.72
7	8.05	MEDIUM	0.80
8	7.39	LOW	1.00
9	4.58	LOW	0.50
10	8.74	MEDIUM	1.00
11	134.84	EXTREMELY-HIGH	1.00

Data-Driven Construction

Structure and Parameters

Structure:

- Input and output variables. For dynamic systems also the representation of the dynamics.
- Number of membership functions per variable, type of membership functions, number of rules.

Parameters:

- Consequent parameters (least squares).
- Antecedent membership functions (various methods).

Least-Squares Estimation of Singletons

R_i : If \mathbf{x} is A_i then $y = b_i$

- Given A_i and a set of input–output data:

$$\{(\mathbf{x}_k, y_k) \mid k = 1, 2, \dots, N\}$$

- Estimate optimal consequent parameters b_i .

Least-Squares Estimation of Singletons

1. Compute the membership degrees $\mu_{A_i}(\mathbf{x}_k)$

2. Normalize

$$\gamma_{ki} = \mu_{A_i}(\mathbf{x}_k) / \sum_{j=1}^K \mu_{A_j}(\mathbf{x}_k)$$

(Output: $y_k = \sum_{i=1}^K \gamma_{ki} b_i$, in a matrix form: $\mathbf{y} = \Gamma \mathbf{b}$)

3. Least-squares estimate: $\mathbf{b} = [\Gamma^T \Gamma]^{-1} \Gamma^T \mathbf{y}$

Least-Square Estimation of TS Consequents

$$\mathbf{X} = \begin{bmatrix} \mathbf{x}_1^T \\ \mathbf{x}_2^T \\ \vdots \\ \mathbf{x}_N^T \end{bmatrix}, \quad \mathbf{y} = \begin{bmatrix} y_1 \\ y_2 \\ \vdots \\ y_N \end{bmatrix}, \quad \mathbf{W}_i = \begin{bmatrix} \gamma_{i1} & 0 & \cdots & 0 \\ 0 & \gamma_{i2} & \cdots & 0 \\ \vdots & \vdots & \ddots & \vdots \\ 0 & 0 & \cdots & \gamma_{iN} \end{bmatrix}$$

$$\theta_i = [\mathbf{a}_i^T \quad b_i]^T, \quad \mathbf{X}_e = [\mathbf{X} \quad \mathbf{1}]$$

Least-Square Estimation of TS Consequents

- **Global LS:** $\theta' = [(\mathbf{X}')^T \mathbf{X}']^{-1} (\mathbf{X}')^T \mathbf{y}$

with $\mathbf{X}' = [\mathbf{W}_1 \mathbf{X}_e \quad \mathbf{W}_2 \mathbf{X}_e \quad \dots \quad \mathbf{W}_c \mathbf{X}_e]$

and $\theta' = [\theta_1^T \quad \theta_2^T \quad \dots \quad \theta_c^T]^T$

Least-Square Estimation of TS Consequents

- **Global LS:** $\theta' = [(\mathbf{X}')^T \mathbf{X}']^{-1} (\mathbf{X}')^T \mathbf{y}$

with $\mathbf{X}' = [\mathbf{W}_1 \mathbf{X}_e \quad \mathbf{W}_2 \mathbf{X}_e \quad \dots \quad \mathbf{W}_c \mathbf{X}_e]$

and $\theta' = [\theta_1^T \quad \theta_2^T \quad \dots \quad \theta_c^T]^T$

- **Local LS:** $\theta_i = [\mathbf{X}_e^T \mathbf{W}_i \mathbf{X}_e]^{-1} \mathbf{X}_e^T \mathbf{W}_i \mathbf{y}$

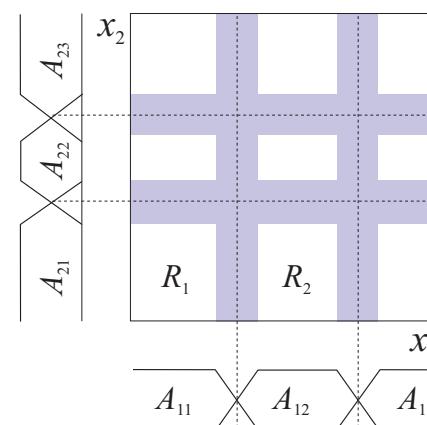

Antecedent Membership Functions

- templates (grid partitioning),
- nonlinear optimization (neuro-fuzzy methods),
- tree-construction
- product space fuzzy clustering

Template-Based Modeling

Determine membership functions a priori (shape, number).

- Only for small problems (1 to 3 inputs).

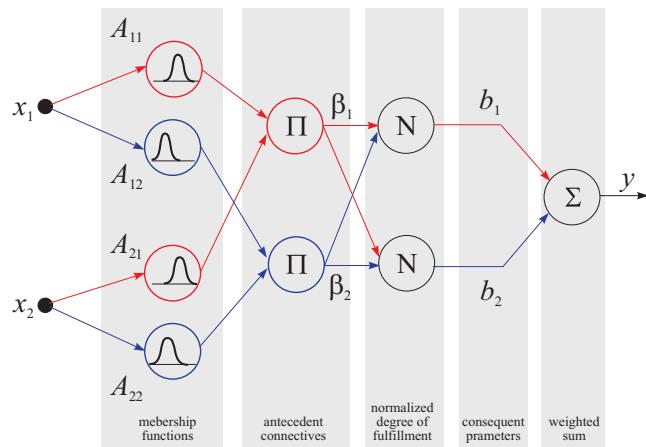

$$K = \prod_{j=1}^p N_j$$

Nonlinear Optimization (Neuro-Fuzzy Learning)

If x_1 is A_{11} and x_2 is A_{21} then $y = b_1$

If x_1 is A_{12} and x_2 is A_{22} then $y = b_2$

R. Babuška, Delft Center for Systems and Control, SC4081

37

Smooth Membership Functions

$$\mu(x; c, \sigma) = \exp\left(-\left(\frac{x - c}{2\sigma}\right)^2\right)$$

$$y = \frac{\sum_{i=1}^K \exp\left(-\left(\frac{x - c_i}{2\sigma_i}\right)^2\right) b_i}{\sum_{i=1}^K \exp\left(-\left(\frac{x - c_i}{2\sigma_i}\right)^2\right)}$$

Adjust parameters c_i and σ_i (nonlinear optimization):

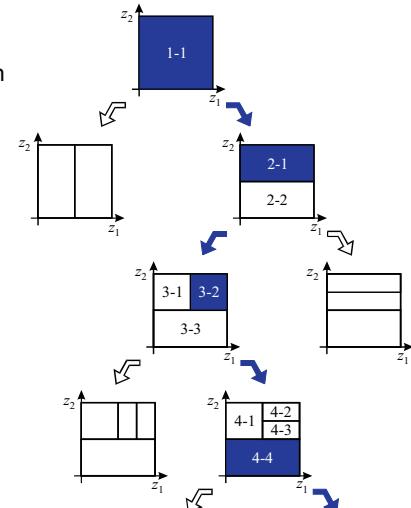

- Gradient-based: (back-propagation, Levenberg-Marquardt).
- Gradient-free: (Nelder-Mead, GA, simulated annealing).

R. Babuška, Delft Center for Systems and Control, SC4081

38

Tree-Construction Methods

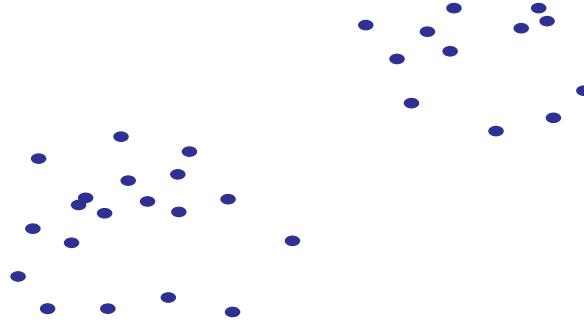

- Growing: Adds one LLM/rule in each iteration
- Axis-orthogonal partition of the input space
- Placement of the membership functions
 1. Division of the worst performing LLM
 2. Test division in each input dimension
 3. Best performing division is realized
- Separate estimation of the newly generated LLMs (weighted least squares)

R. Babuška, Delft Center for Systems and Control, SC4081

39

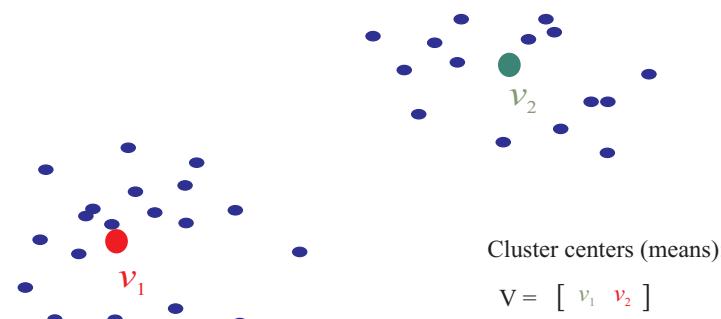

Fuzzy Clustering: Data

R. Babuška, Delft Center for Systems and Control, SC4081

40

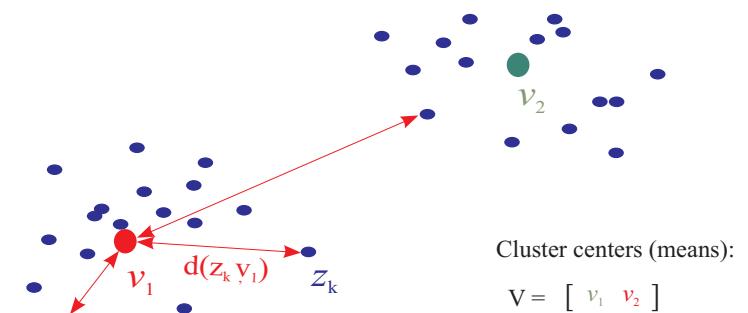

Fuzzy Clustering: Prototypes

R. Babuška, Delft Center for Systems and Control, SC4081

41

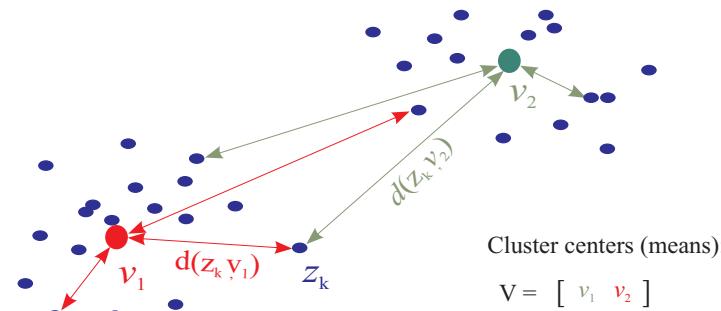

Fuzzy Clustering: Distance

R. Babuška, Delft Center for Systems and Control, SC4081

42

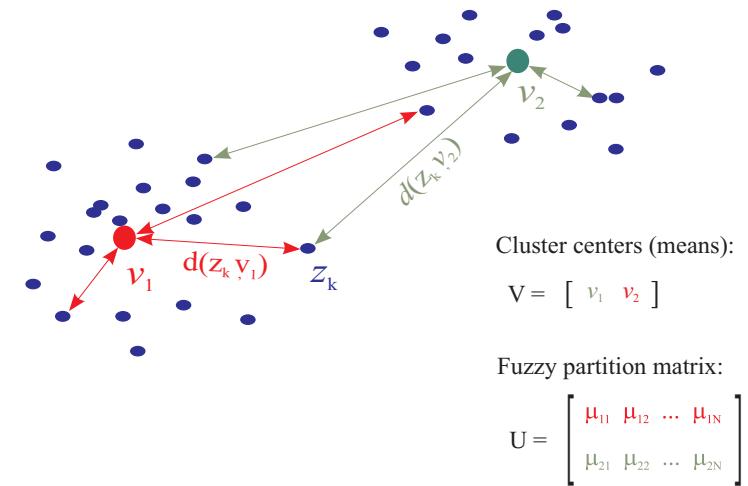

Fuzzy Clustering: Distance

R. Babuška, Delft Center for Systems and Control, SC4081

43

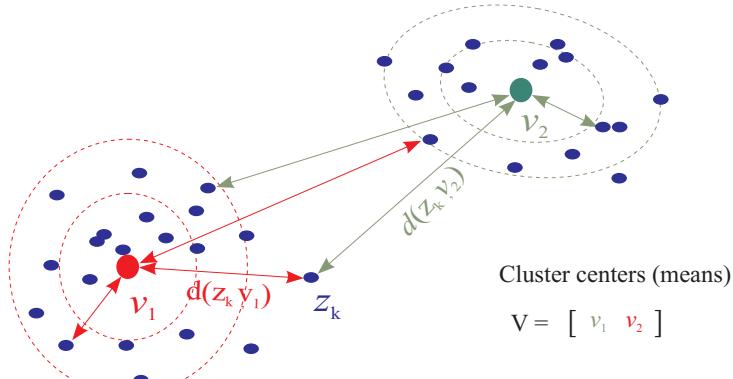

Fuzzy Clustering: Partition Matrix

R. Babuška, Delft Center for Systems and Control, SC4081

44

Fuzzy Clustering: Shapes

R. Babuška, Delft Center for Systems and Control, SC4081

45

Fuzzy Clustering Problem

Given the data:

$$\mathbf{z}_k = [z_{1k}, z_{2k}, \dots, z_{nk}]^T \in \mathbb{R}^n, \quad k = 1, \dots, N$$

Find:

the fuzzy partition matrix:

$$\mathbf{U} = \begin{bmatrix} \mu_{11} & \dots & \mu_{1k} & \dots & \mu_{1N} \\ \vdots & \dots & \vdots & \dots & \vdots \\ \mu_{c1} & \dots & \mu_{ck} & \dots & \mu_{cN} \end{bmatrix}$$

and the cluster centers:

$$\mathbf{V} = \{\mathbf{v}_1, \mathbf{v}_2, \dots, \mathbf{v}_c\}, \quad \mathbf{v}_i \in \mathbb{R}^n$$

R. Babuška, Delft Center for Systems and Control, SC4081

46

Fuzzy Clustering: an Optimization Approach

Objective function (least-squares criterion):

$$J(Z; \mathbf{V}, \mathbf{U}, \mathbf{A}) = \sum_{i=1}^c \sum_{j=1}^N \mu_{i,j}^m d_{A_i}^2(\mathbf{z}_j, \mathbf{v}_i)$$

subject to constraints:

$$0 \leq \mu_{i,j} \leq 1, \quad i = 1, \dots, c, \quad j = 1, \dots, N \quad \text{membership degree}$$

$$0 < \sum_{j=1}^N \mu_{i,j} < 1, \quad i = 1, \dots, c \quad \text{no cluster empty}$$

$$\sum_{i=1}^c \mu_{i,j} = 1, \quad j = 1, \dots, N \quad \text{total membership}$$

R. Babuška, Delft Center for Systems and Control, SC4081

47

Fuzzy c-Means Algorithm

Repeat:

1. Compute cluster prototypes (means): $v_i = \frac{\sum_{k=1}^N \mu_{i,k}^m \mathbf{z}_k}{\sum_{k=1}^N \mu_{i,k}^m}$

R. Babuška, Delft Center for Systems and Control, SC4081

48

Fuzzy c-Means Algorithm

Repeat:

1. Compute cluster prototypes (means): $v_i = \frac{\sum_{k=1}^N \mu_{i,k}^m \mathbf{z}_k}{\sum_{k=1}^N \mu_{i,k}^m}$

2. Calculate distances: $d_{ik} = (\mathbf{z}_k - \mathbf{v}_i)^T (\mathbf{z}_k - \mathbf{v}_i)$

Fuzzy c-Means Algorithm

Repeat:

1. Compute cluster prototypes (means): $v_i = \frac{\sum_{k=1}^N \mu_{i,k}^m \mathbf{z}_k}{\sum_{k=1}^N \mu_{i,k}^m}$

2. Calculate distances: $d_{ik} = (\mathbf{z}_k - \mathbf{v}_i)^T (\mathbf{z}_k - \mathbf{v}_i)$

3. Update partition matrix: $\mu_{ik} = \frac{1}{\sum_{j=1}^c (d_{ik}/d_{jk})^{1/(m-1)}}$

until $\|\Delta \mathbf{U}\| < \epsilon$

Distance Measures

- Euclidean norm:

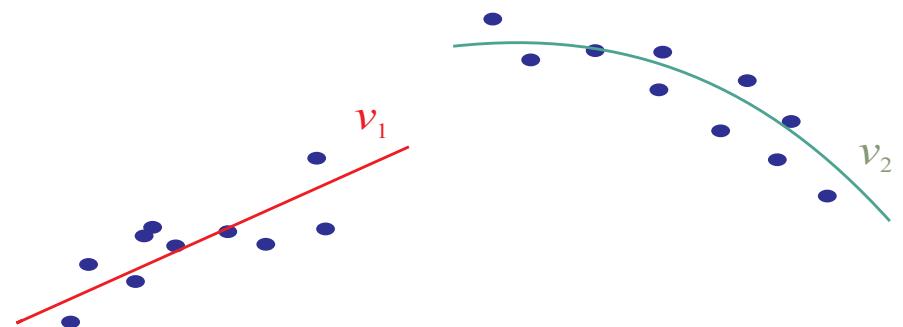

$$d^2(\mathbf{z}_j, \mathbf{v}_i) = (\mathbf{z}_j - \mathbf{v}_i)^T (\mathbf{z}_j - \mathbf{v}_i)$$

- Inner-product norm:

$$d_{A_i}^2(\mathbf{z}_j, \mathbf{v}_i) = (\mathbf{z}_j - \mathbf{v}_i)^T A_i (\mathbf{z}_j - \mathbf{v}_i)$$

- Many other possibilities ...

Generalized Prototypes

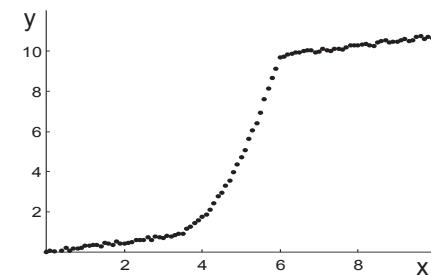

lines, circles, ellipses, functions, etc.

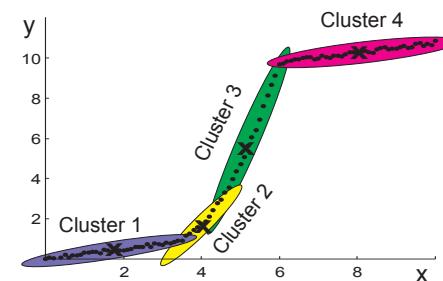

Fuzzy Clustering – Demo

1. Fuzzy c -means
2. Clustering with adaptive distance measure
3. Line detection by clustering

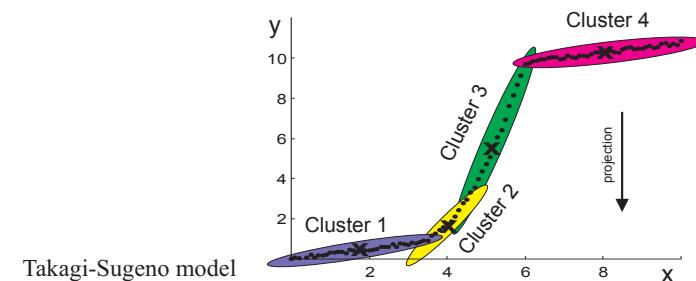

Extraction of Rules by Fuzzy Clustering

Extraction of Rules by Fuzzy Clustering

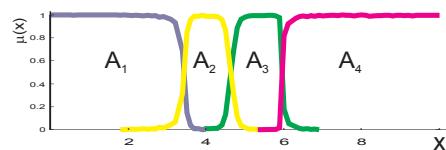

Extraction of Rules by Fuzzy Clustering

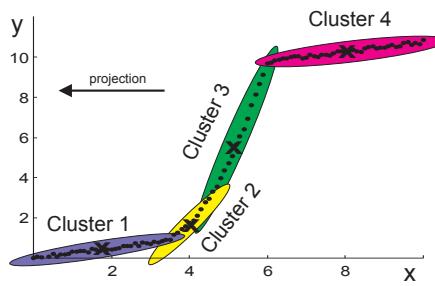

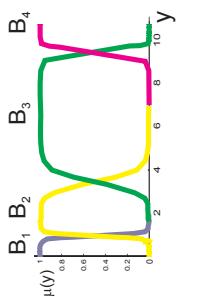

Takagi-Sugeno model

Rule-based description:
If x is A_i then $y = a_i x + b_i$
If x is A_2 then $y = a_2 x + b_2$
etc...

Extraction of Rules by Fuzzy Clustering

Rule-based description:
If y is B_1 , then $x = a_1y + b_1$
If y is B_2 , then $x = a_2y + b_2$
etc...

Inverse Takagi-Sugeno model

Semi-Mechanistic Modeling

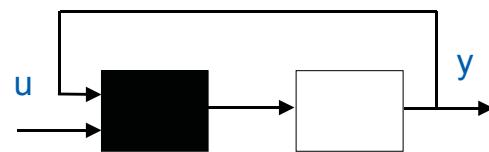

- White-box model developed for well-known parts.
 - Black-box or knowledge-based model for unknown relationships.
- + effective use of all available information
+ extrapolation, scalability
+ short development time

Rule Extraction – Demo

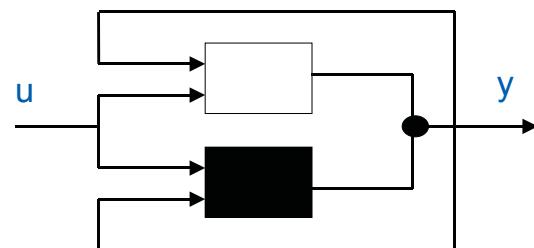

- Extraction of Takagi–Sugeno rules

Semi-Mechanistic Modeling – Structures

Serial

Parallel

Semi-Mechanistic Modeling: Example
